

CIVILITY : **cloud based Interactive Visualization** **of Tractography Brain Connectome**

DOCUMENTATION

Circle visualization

Brain template visualization

CONTENTS

1. Application architecture and installation
2. Jobs and Tractography pipeline
3. Run jobs and results
4. Brain connectome visualization
5. Appendices

Introduction

CIVILITY is a web application and has mainly 2 components.

- **CIVILITY-visualization** ; front end of the application. This is a circle plot of the brain connectivity using the method of visualization : Hierarchical Edge Bundling. The graphic visualization of the brain connectivity is generated using Data Driven Documents (D3.js).
- **CIVILITY-tractography** ; analysis pipeline. The analysis of the brain connectome is computed using a probabilistic method (FSL tools) using surfaces as seeds.

CIVILITY performs the brain connectivity analysis in remote computing grids where the CIVILITY-tractography pipeline is deployed. CIVILITY uses clusterpost (<https://github.com/NIRALUser/clusterpost>) to submit the jobs to the computing grid. Clusterpost is a server application providing a REST api to submit jobs in remote computing grids using. Data transfer, job execution and monitoring are all handled by clusterpost. The front end of CIVILITY submits tasks to clusterpost and retrieves the results when they are finished.

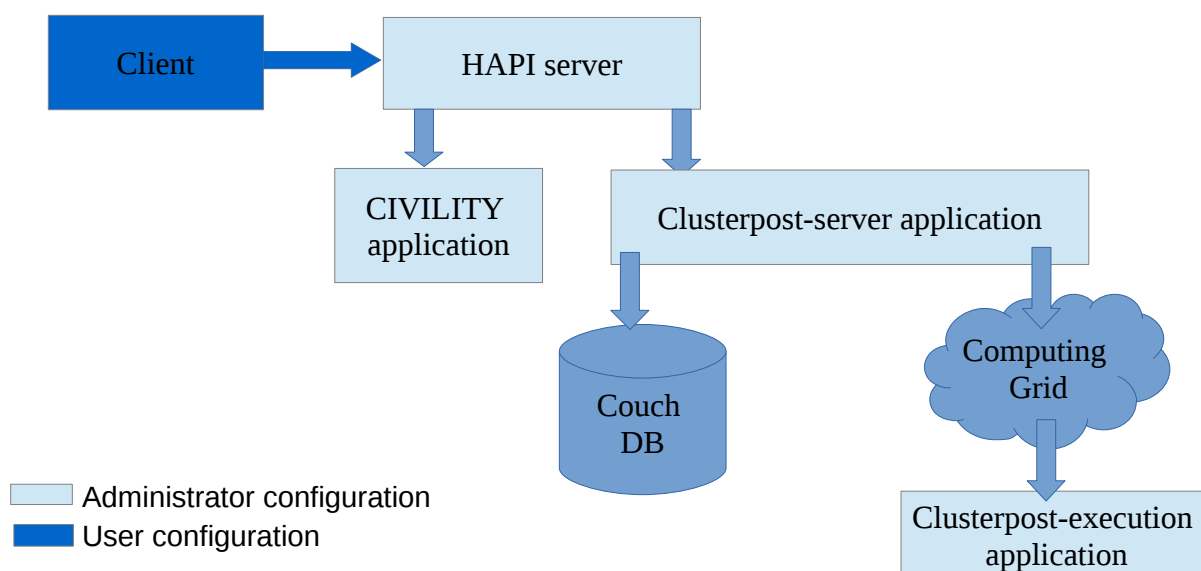

In this documentation, the configuration of the application is first described, then the tractography pipeline is explained in details and finally the interactive visualization method are presented.

1. Application architecture and installation

This section describes the architecture of the application, and how to configure it.

1.1. Architecture

Here is the architecture of the application CIVILITY and its dependencies.

Architecture of CIVILITY application

CIVILITY application is running on a HAPI server – this server must have an IP public to be accessible by everyone in the institution. CIVILITY users had privileges associated. By default, the user can only access to the Visualization tab (inputs are system files), the scope “clusterpost” needs to be added by an administrator to have access to the computing grid and launches jobs. Also, an “admin” scope is required to have access to the whole database, set user privileges etc.

To be able to launch tractography jobs on a computing grid server, the application CIVILITY requires another plugin clusterpost-server running on the same HAPI server which must be configured properly by an administrator.

Clusterpost-server plugin is a server side application using REST api. It creates/posts 'job' document describing the task and input data, run tasks on remote computing grids and retrieves outputs throw a database. All process is done automatically.

The documentation of the plugin clusterpost-server and its configuration are available here :

<https://www.npmjs.com/package/clusterpost-server>.

An other plugin called clusterpost-execution must be installed in the computing grid server. This plugin downloads data from the data provider to the local disk, submits tasks to the kob manager. It also checks if the task has finished and upload the results back to the dataprovider (database).

The documentation of the plugin clusterpost-execution and its configuration are available here :

<https://www.npmjs.com/package/clusterpost-execution>

The next paragraph will explain how to deployed the plugin CIVILITY.

1.2. Application deployment

To deployed the application :

git clone : <https://github.com/NIRALUser/CIVILITY>

Then, in this cloned directory, on the terminal do :

```
npm install
```

Finally, to start the application the administrator must update the file : conf.production.json according to the clusterpost-server documentation :

<https://www.npmjs.com/package/clusterpost-server> and then in the terminal in the application directory do :

```
NODE_ENV=production node index.js
```

The application is now running.

The administrator must also install all tools required by the tractograpy pipeline in the Computing Grid server.

Tools required :

CIVILITY : Cloub based Interactive Visualization of Tractography Brain Connectome

- FSL : bedpostx and probtrackx2 tools

<http://fsl.fmrib.ox.ac.uk/fsl/fslwiki/FslInstallation>

FSL must be installed through FSL website

- DWIConvert : <https://github.com/BRAINSia/BRAINSTools/tree/master/DWIConvert>

→ using ITK : <https://itk.org/ITK/resources/software.html>

SlicerExecutionModel : <https://github.com/Slicer/SlicerExecutionModel>

- ExtractLabelSurfaces : <https://github.com/danaele/ExtractLabelSurfaces>

→ using RapidJSON : <https://github.com/miloyip/rapidjson>

SlicerExecutionModel (using ITK)

VTK : <https://gitlab.kitware.com/vtk/vtk.git>

In this directory <https://github.com/NIRALUser/CIVILITY/tree/master/src/civility-tractography> you can find the CmakeLists.txt file which installs tools DWIConvert and ExtractLabelSurfaces with all their dependencies.

Python must also be installed.

In the computing grid, every script in the script/ folder **must be executable.**

1.3. User configuration

1.3.1. *Run application*

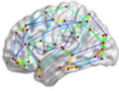

Open an internet browser and connect to the website

<https://tethys.med.unc.edu:8180>

If the browser warning you about certificates, permissions – you must accept the exceptions and get the certificate. Go in advanced options in your browser and Add exception to get the certificate and then confirm the security exceptions.

1.3.2. *User account*

First, each user needs to be authenticated to use CIVILITY application ; a user account is required.

CIVILITY
Cloud based Interactive Visualization of Tractography Brain Connectome

Please login

Login

[forgot your password? click here](#)
[new user? create new account](#)

Home page of CIVILITY

Create account

On first use, the user must create an account. Click on the link : “*create new account*”. You are redirected to a new page* with a form to complete.

Set *user name*, *email address* and *password* (the password must contain 6 characters, including at least one uppercase letter, one lowercase letter, one number) and click on the button : “*Create and Login*”. The user account is created and automatically login to the application.

An alert window appears at the creation of the account specifying to the user to send an email to the Application administrator if he wants to be able to launch tractography scripts.

**On this page page, user still can return to the login page by clicking on “Login with your account”.*

Login

If the user already has an account, fill the form on the home page by providing an *email address* and *password* (the password must contain 6 characters, including at least one uppercase letter, one lowercase letter, one number) and click on the button : “*Login*”.

The user is logging into the application.

Forgot password

If you don't remember your password, fill the field Email Address in the Home page and then click on the link : “*Forgot your password ? click here*”.

An email will be sent to your email address containing a link. This link will redirect you to a reset page. On the page you need to type 2 times your new password and then click on “*Reset and Login*” button to login into the Application.

Once the user is connected to the application, three main tabs are available.

The first tab is a form where users upload files and set some parameters for the tractography. The second tab is a summary of all jobs launched by the user. And the tab “visualization” allow user to print Brain Connectome by uploading files from user system.

Header of CIVILITY Application – View of all tabs

The next section explains how to launch jobs and describes the tractography pipeline running.

2. Jobs and Tractography pipeline

2.1. Tractography pipeline

CIVILITY computes the brain connectome with a probabilistic method of tractography using surfaces as seeds. The tractography is computed by using FSL tools : bedpostx and probtrackx2.

First, all images and surfaces of the subjects required for the tractography are :

- DWI (diffusion weighted imaging) image (.nrrd)
- T1 image – **must be in the DWI space** (.nrrd)
- Brain mask – **must be in the DWI space** (.nrrd)
- Inner surface – **must be in the DWI space** (.vtk)

This surface must contain a color label for each region.

If the surface doesn't contain label information, you must provide another surface with label information which must be the same mesh as the Inner surface – in DWI space. (example : you can use the middle surface)

All images and surfaces must be in the same space which is the DWI space (also called Diffusion space).

Another file is required is the parcellation table which is a json file describing the brain atlas. The structure of this json file is described in the **appendix 2**.

Pipeline :

- Creation of the diffusion data for using bedpostx
 - create Diffusion directory
 - convert DWI et brain mask images to Nifti format (.nii.gz)
- BedpostX (FSL tool) , fitting of the probabilistic diffusion model on data. The voxel fitting uses 2 tensors by default.
- Creation of seed surfaces (ExtractLabelSurfaces tool) : each seed is created as an ASCII file (.asc) describing the mesh
- Write the seeds list, run a python script writeSeedList.py which write all paths to the seeds surfaces (.asc file) according to the description table (.json file)
- Convert T1 image to nifti format with DWIConvert tool
- Run probtrackx2 (FSL tool), computation of the tractography according to the seeds list created.

default command line : bedpostX DiffusionDir -n 2

default command line : probtrackx2 --samples=\${SUBJECT}/Diffusion.bedpostX/merged --mask=\${SUBJECT}/Diffusion.bedpostX/nodif_brain_mask --seed=\${SUBJECT}/seeds.txt --seedref=\${T1_nifti} --forcedir --network --omatrix1 -V 0 --dir=\${NETWORK_DIR} --stop=\$

```
{SUBJECT}/seeds.txt ${probtrackParam} ${loopcheckFlag} -P 3000 --steplength=0.75  
--sampvox=0.5
```

- Normalization of the connectivity matrix
- Save the matrix plotting (color grid) as a pdf file – run a python script : `plotMatrix.py`

The shell script executed this pipeline is available here :

<https://github.com/NIRALUser/ProbtrackBrainConnectivity/blob/master/ScriptsApp/tractographyScriptApp.sh>

Python scripts which create the seeds list and the figure of the matrix as PDF are available :

<https://github.com/NIRALUser/ProbtrackBrainConnectivity/tree/master/ScriptsApp/>

2.2. Run jobs

To run a user must complete the form (see Appendix 1) in the Tractography application tab do :

- Set a job name ; to identify the job.

This id/name will be the name of the directory containing all outputs of the pipeline

- Upload DWI image. The file format is NRRD.
- Upload T1 image. This brain mask must be in the same space as the DWI space, so it must be in the diffusion space. The file format is NRRD.
- Upload brain mask. This image must also be in the diffusion space. The file format is NRRD.
- Upload the parcellation table. This file is a description of the parcellation table (ROIs). This file also describes the way how to plot the brain connectome in circle plot and also contains information about matrix rows. See appendix 2 to have more details about the file architecture. The file format is JSON.
- Upload the Inner surface. This is a VTK file which represents the white matter surface. This surface must be in the diffusion space.
- This surface contains labels for each region ?
In the vtk file is ROIs are identified with labels, check the box. By default is checked.
If there is no labels to identify ROIs in the VTK surface, you must upload another surface (for example grey matter surface called Middle Surface) with the same mesh and containing labels information. This second surface must also be on the diffusion space.
- In the VTK file containing labels, the labelset is identified by an ID. You must specify this labelset name in the text box associated.
- If you want to ignore a label in the vtk file, check to box "Ignore label" and enter the value/ID of

the label to ignore (example : “0 0 0”).

- There is an additional option in the surface extraction : overlapping. If the checkbox corresponding to “Overlapping” is selected that mean each region overlaps the neighboring regions. (by default : selected).

*For FSL tools, it's possible to modify their parameters. Parameters write in **bold** can't be modified.*

- Bedpostx parameters

By default the number of tensors in the voxel fitting is equal to 2. You can modify bedpostx parameters if you are familiar with this tool by clicking on the checkbox “Modify”.

- Probtrackx2 parameters

Select loopcheck or not for the tractography computation.

Probtrackx2 help → Loopcheck: By default, we terminate pathways that loop back on themselves -i.e. paths that travel to a point where they have already been.

You can modify probtrackx2 parameters if you are familiar with this tool by clicking on the checkbox “Modify”.

- Select server where the tractography is computed – by default the first server found is selected

- Finally click on “Start tractography” button to submit the job to server selected before.

Tractography can take +/- 1 week of computation.

2.3. Jobs results

Once a job is submitted, a summary of all jobs is available in the tab : Jobs.

Each job get a current status, which indicates in which step of the

-Status list :

- CREATE : job document is created, but it is not running on the computing grid.
- DOWNLOADING : inputs files are downloaded to the database.
- RUN : job is running on the computing grid
- KILL : job is killing
- FAIL : error in the pipeline, job fail
- UPLOADING : output data are uploaded to the database
- DONE : the job is finished, all data are stored in the DB.
- EXIT : if the job failed, the job ended by the status EXIT

For each jobs launched, some options are available according to the job status (see Appendix 4).

All jobs can be filtered by the status (see figure below).

Jobs summary

Select status : (default : DONE)

Jobs tab header

Options :

- Update status

Connectivity visualisation

- Connectivity Visualization (see visualization methods in the next section)

Download output directory

- Download output directory → to save results in user system

Print job info

- Print job information → allow user to check the files uploaded and parameters submitted

Restart

- Restart the job → user can restart the job at any time.

If the status is CREATE, user can restart the job easily. For all other status, user has to force the job submission. Before force the job submission, check the output log files and check inputs files you've uploaded to be sure you've submitted nothing wrong.

View log output

- View log output → Print the content of the log output file

If the line : `ERROR_PIPELINE_PROBTRACKBRAINCONNECTIVITY` appears in the log file, that means there is an error during the pipeline so input files or parameters submitted are wrong.

View log error output

- View logs error output → Print the content of log error output file

Kill Job

- Kill Job → kill the job which is currently running

Delete job in database

- Delete Job → delete the job from the database

3. Brain connectome visualization method

The brain connectome can be visualized in 2 different ways :

- in circle plot (using method of visualization : Hierarchical Edge Bundling)
- on brain brain templates (not print by default : check the box)

The brain connectome can be visualized by clicking on the button : *Connectivity Visualization* in the tab *Jobs* when a job is done. Or through the tab *Visualization* by upload the connectivity matrix and the parcellation file (json) from user system.

To visualize the plot on brain templates, user must select the checkbox : *Visualization brain*

template connectivity.

See appendix 4.

Method of computation

The brain connectome plots are the result of the connectivity matrix (output of probtrackx2) normalized by the number of streamlines per seeds (rows) and then triangulate. The triangular matrix can be computed by 3 different ways.

- Average between the lower and upper triangular matrix
- Maximum value between the lower and upper triangular matrix
- Minimum value between the lower and upper triangular matrix

The user can select the method he prefers.

Links : - Links colors indicate the connectivity value according the color bar

- The thickness of the link is proportional to the connectivity value
- Mouse over the links on circle plot:

A tooltip indicates the connectivity value

Seeds names are bigger and bold for a better visualization

- Mouse over nodes of brain template:

A tooltip indicates the seed name

Threshold : The connectivity visualized can be threshold between 2 values.

- All links with a connectivity value inferior to the threshold value are not printed.
- All links with a connectivity value superior to the maximum threshold value are red.

NOTE :

The slide bar above “Tension splines value” modifies the shape of links in the circle plot by changing their tension value.

The diameter circle can also be set.

The mesh of nodes on brain templates can be re-scale and X-offset or Y-offset can be set.

The image of brain template can also be re-scaled.

The button *Reset position*, resets all offsets and changing scale the user did.

See appendix 4.2.

APPENDICES

1. Tractography form

Probabilistic tractography with FSL tools

Job name :

Load data :

DWI Image (.nrrd) :

2. Parcellation table

This file is a description of the parcellation table (brain atlas). This is a json object is an array of objects defined like bellow :

Structure :

```
[
  {
    Object 1 / Region 1
  },
  {
    Object 2 / Region 2
  },
  ...
  {
    Object N / Region N
  }
]
```

Object X :

//Object corresponding to one region – this example is based on the AAL90 parcellation table

```
{
  "VisuOrder": 78,           //This is the rank in the circle plotting
  "MatrixRow": 1,           // Rank in the connectivity matrix - first row = 1 = first column ( if = -1
                             // not in the matrix )
  "name": "Precentral_L",    //Name of the region/seed
  "VisuHierarchy": "seed.left.frontal.", //Hierachy of the seed (for circle plotting)
  "coord": [                //Coordinates of the seed
    -38.65, // X
    -5.68, // Y
    50.94 // Z
  ],
  "labelValue": "131 44 78", //Value of the label in the vtk file
  "AAL_ID": 1                // label/seed ID in the AAL90 table
}
```

3. Jobs informations examples
